--Abstract

10           The method is for a random-based decision making process. A communication device is activated and a menu is displayed. In a selecting step a random generating item is selected from the menu. The variables are then defined and the variables may be provided with different weighing factors. A random generator generates a random result based on the weighed variables. The random result is presented in  
15           the communication device. The presentation may be made at a random time, a specific time or right after the generation of the result.--
